Began lab by installing Hyper-V, enabling virtualization in system UEFI.
Created Hyper-V folder with the following sub folders; Exports, ISOs,
VHDX, VMs. Created two switches Lab-Corp-1 and Lab-Corp-Branch.
Assigned both switches private IP's

Try these in order:

1. Click once inside the VM window, then press `Tab` .
 - If the selection moves, the keyboard is working.
 - If you see **Press any key to boot from CD or DVD**, restart the VM and immediately click inside it and press `Spacebar` .
2. In the VM connection window, select:

Action → Ctrl+Alt+Delete

If Windows responds, the VM console has keyboard control.

3. If it still does not respond:
 - Close only the VM connection window.
 - Leave the VM running.
 - In Hyper-V Manager, right-click the VM and select **Connect** again.
4. Check Hyper-V's keyboard setting:
 - Select your host in Hyper-V Manager.
 - Open **Hyper-V Settings**.
 - Under **User** → **Keyboard**, select **Use on the virtual machine**.
 - Click **Apply** → **OK**, then reconnect.
5. If Enhanced Session Mode is active, select **View** → **Enhanced session** to turn it off temporarily, then reconnect using the basic console.

If this is the initial Windows installation and it remains frozen, turn the VM off, start it again, immediately click inside the console, and repeatedly press `Spacebar`. Tell me which VM and what screen you're currently seeing if that does not work.

Began lab by installing Hyper-V, enabling virtualization in system UEFI. Created Hyper-V folder with the following sub folders; Exports, ISOs, VHDX, VMs. Created two switches Lab-Corp-1 and Lab-Corp-Branch. Assigned both switches private IP's. Installed windows server 2025 desktop experience on DC01 and SRV01. Installed windows 11 pro on MGMT-CL01.

Worked for 1m 25s >

Logged as **Lab 01: Hyper-V Enterprise Lab Foundation — Complete.**

Evidence confirms:

- Hyper-V installed after enabling UEFI virtualization.
- C:\HyperV-Lab created with Exports , ISOs , VHDX , and VMs .
- Two internal switches:
 - LAB-Corp-1
 - Lab-Corp-Branch
- Host vEthernet adapters configured:
 - Corporate: 172.16.10.254/24
 - Branch: 172.16.20.254/24
- Three Generation 2 VMs provisioned on LAB-Corp-1 :
 - CORP-DC1 — Windows Server 2025 Standard Evaluation
 - CORP-SRV01 — Windows Server 2025 Standard Evaluation
 - MGMT-CL01 — Windows 11 Pro
- Secure Boot, production checkpoints, and graceful shutdown configured.
- TPM enabled for the Windows 11 VM.
- Operating systems installed and computer names verified.

One naming detail: the evidence shows CORP-DC1 , while the original plan used CORP-DC01 . Either works, but choose one now—before installing Active Directory—and use it consistently.

The separate CORP-SRV01 data disk can be deferred to the file-server lab. Lab 02 can now begin with static addressing, AD DS, DNS, and creation of corp.ms1ab.test .

Create a DPF document such as the ones used for my AWS Labs
